Attachment: 9091 Soybean (March 1987) 8700100

Exhibit A: Variety **9091** evolved from a cross of Peterson 85 x variety 1677. It is an F5-derived variety which was advanced to the F5 generation by modified single-seed descent. The F6 progeny row of **9091** was grown in Iowa during the summer of 1981. Subsequently, **9091** has undergone five years of extensive testing and purification and has been observed by the breeder to be uniform and stable for all plant traits from generation to generation, with no evidence of variants.

Three acres of **9091** (breeders seed) were grown in 1985. 47 acres of parent seedstock (foundation seed equivalent) were grown in 1986.

Exhibit B: Variety **9091** is most similar to variety 9061. Both varieties have purple flowers, gray pubescence and yellow seeds with yellow hila. Variety **9091** has tan pods and is susceptible to race 1 of Phytophthora root rot whereas 9061 has brown pods and is resistant to race 1.

Exhibit E: Pioneer Hi-Bred International, Inc. is the sole, original, and first breeder of soybean variety **9091**, for which it solicits a certificate of protection.
